Key indicators

Single-crystal X-ray study
 $T = 173\text{ K}$
Mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$
 R factor = 0.067
 wR factor = 0.177
Data-to-parameter ratio = 20.9

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

In the crystal structure of the title compound, $C_{13}H_{12}O_3S$, the dihedral angle between the mean planes of the 4-tolyl and phenyl rings is $52.6(1)^\circ$. There are weak C—H···O hydrogen bonds, which generate rings of graph-set motifs $R_1^2(4)$ and $R_2^1(9)$. The supramolecular aggregation is completed by the presence of van der Waals short contacts and C—H···π interactions.

Comment

Aromatic sulfonates are used in monitoring the merging of lipids (Yachi *et al.*, 1989) and in many other fields (Spungin *et al.*, 1992; Tharakan *et al.*, 1992; Alford *et al.*, 1991; Jiang *et al.*, 1990; Narayanan & Krakow, 1983). The crystal structure of the title compound was determined because of the biological importance of its analogues. A search of Version 5.23 (July 2002 updates) of the Cambridge Structural Database (Allen, 2002) revealed 16 structures [refcodes KAWDAN (Niestroj *et al.*, 1998), FIXCAQ (Chinnakali *et al.*, 1999), NEDXUP, NEDYAW and NEDYIE (Gallucci *et al.*, 1998), NUNCII (Goswami *et al.*, 1998), RASSOT (İşik *et al.*, 1997), RELVUZ (Bott *et al.*, 1996), SIMVUF (Bindal *et al.*, 1990), TCPTOS (Wieczorek & Galdecki, 1978), TEBFOV (Prince *et al.*, 1991), TMPDTS (Wieczorek *et al.*, 1975), TSMIPH (Sarkar & Gupta, 1980), WOHCUR (Meents *et al.*, 2000), ZZZBDA10 (Wieczorek, 1980) and MIWHIJ (Lee *et al.*, 2001)] that are closely related to the title compound in having benzene rings attached to the sulfonate group. The S—C, S—O and S=O bond lengths (Table 1) are comparable to those found in related structures (Vembu, Nallu, Garrison & Youngs, 2003a,b,c,d,e,f; Vembu, Nallu, Spencer & Howard, 2003a,b,c,d,e,f,g; Vembu *et al.*, 2003; Vembu, Nallu, Durmus *et al.*, 2004a,b,c). The molecular structure of (I) is shown in Fig. 1 and selected geometric parameters are given in Table 1. The dihedral angle between the mean planes of the C1–C6 and C8–C13 rings is $52.6(1)^\circ$.

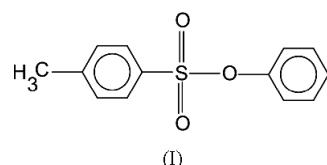

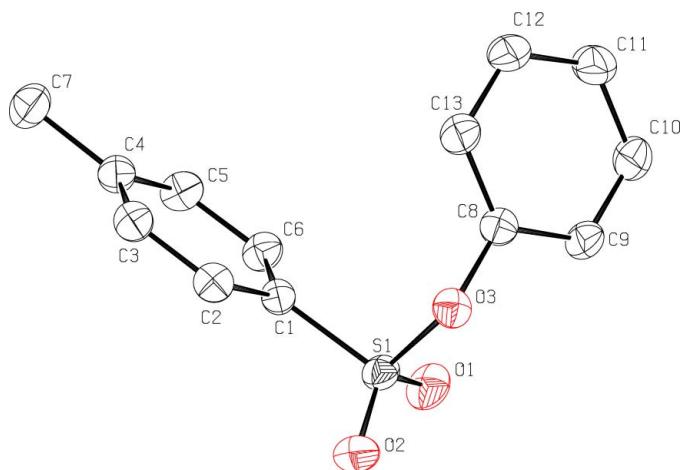

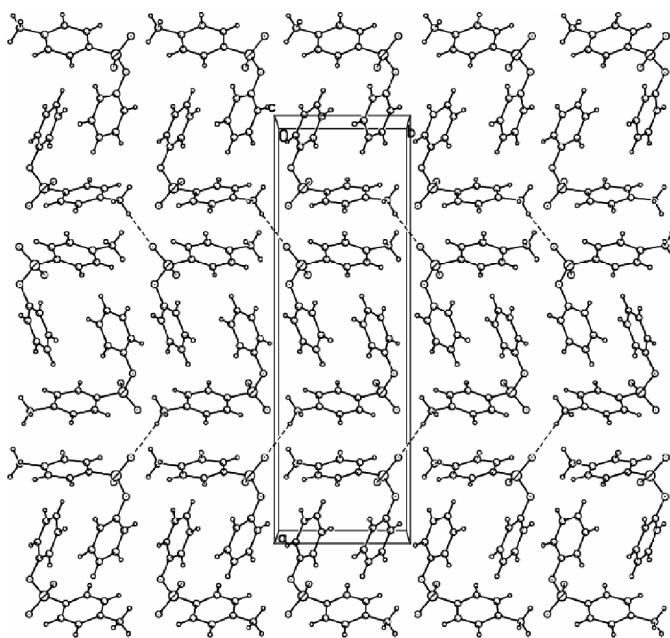

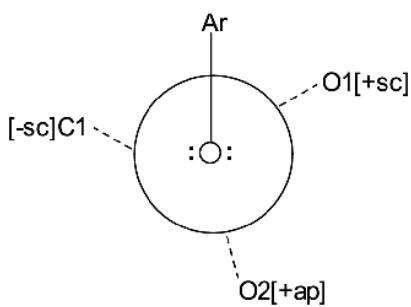

Fig. 2 shows a Newman projection along the S1—O3 bond, with atom C8 at the top for reference. Helical nomenclature is followed in assigning + or -synclinal and +antiperiplanar conformations. Since the C1—S1—O3—C8 torsion angle is $-72.1(2)^\circ$, which corresponds to a -synclinal conformation, the dihedral angle between the two aromatic planes is, as expected, large [$52.6(1)^\circ$].

**Figure 1**

The molecular structure of the title molecule, showing 50% probability displacement ellipsoids. H atoms have been omitted.

**Figure 3**

Packing of the title molecule, viewed down the *c* axis. Dashed lines indicate hydrogen bonds.

-sc : -syn-clinal
+sc : +syn-clinal
+ap : +anti-periplanar

Figure 2

Newman projection of the title molecule, along the S—O bond.

The crystal structure of (I) is stabilized by weak C—H···O interactions (Table 2). The H···O distances found in (I) agree with those found for weak C—H···O bonds (Desiraju & Steiner, 1999). The C2—H2···O1ⁱ and C13—H13···O1ⁱ interactions (see Table 2 for symmetry codes) together constitute a pair of bifurcated acceptor bonds generating a ring of graph set $R_2^1(9)$. The C5—H5···O3ⁱⁱⁱ and C5—H5···O2ⁱⁱ interactions together form a pair of bifurcated donor bonds generating a ring of graph set $R_1^2(4)$. This motif can be considered as a symmetrical three-center hydrogen-bonded chelate, as the difference in H···A distances and D —H···A angles are 0.02 Å and 19.7°, respectively, and the sum of the angles around the chelating H atom is 341°. There are a few other C—H···O, C—H···π and van der Waals interactions, which contribute to the supramolecular aggregation (Fig. 3) of the title compound.

Experimental

4-Toluenesulfonyl chloride (4.7 mmol), dissolved in acetone (4 ml), was added dropwise to phenol (4.3 mmol) in aqueous NaOH (2.5 ml, 10%) with constant shaking. The precipitated compound (2.9 mmol, yield 67%) was filtered off and recrystallized from aqueous ethanol.
